16x 10mm Circle LED Display Board - “Cooper”

www.MaximumOctopus.com/electronics/cooper.htm

You’ll find the latest versions of the instructions and example code at the address above.

Thank you for purchasing the Cooper kit! I hope you have lots of fun with it!

If you have any suggestions for future boards then please let me know. I’ll send you some free boards if I like your idea!

This kit can be controlled by many microprocessors and development boards. I have been using it with the Arduino, Espruino and PICAXE systems.
Kit Contents

This kit was put together by a team of highly skilled octopuses; it should contain the following items:

1) The main PCB
2) 16x 10mm LEDs
3) 16x 330Ω resistors
4) 2x 16 pin DIP sockets
5) 2x 74HC595 shift registers
6) 2x 0.1µF capacitors
7) A 6 pin header

Important Things to Remember

This kit is designed to run from 5V. Do not exceed 5V or the ICs and LED components will be damaged. It will work fine from 4x 1.2V rechargeable batteries.

The LEDs and IC sockets (and corresponding ICs) must be placed on the board in the correct orientation or Cooper will not work.

The two shift register ICs are sensitive to static shocks so handle them with care and avoid touching the legs (pins).

Before soldering any components check and then double-check that they are correctly oriented.

Don’t rush, and have lots of fun!

If you need a good tutorial on soldering then SparkFun Electronics has a good one (https://www.sparkfun.com/tutorials/106) as do Adafruit Industries (http://www.ladyada.net/learn/soldering/thm.html).
Building Instructions

You will need a soldering iron, solder, an octopus (or a set of handy helper things) and wire cutters. To keep some of the large components in place while soldering you might find Blue-Tac useful to stop them moving around or falling off, but be careful not to put it on anything that will get hot (resistor leads, LED leads etc.) or you’ll end up with a hot squidgy mess on your components.

Take your time and check the placement of every component before soldering them in place! All of the components (except for the 6 pin header) sit on the top of the board, solder them to the underside.

**STEP 1 – DIP sockets**

These sockets will eventually hold the two 74HC595 shift registers. Don’t put the chips in just yet, we’ll do that at the very end.

The socket nearest the Octopus logo faces away from the 6 pin header, the socket furthest away faces towards the 6 pin header.

**STEP 2 – Resistors**

Solder each of the 16 330Ω resistors on to the board next. These protect the LEDs from excessive current. It doesn’t matter which way around they go (but I like to make them all face the same way!).

They are labelled on the PCB as R1 to R16.

**STEP 3 – The capacitors**

There are two capacitors (the orange or yellow disc-shaped things) that go on to the board in locations C1 and C2. They are not polarised, they can go in anyway round.

**STEP 4 – Header**

This will be used to connect power and data to the board. It is best placed on the underside of the board, and soldered on top. The pins are labelled (left to right):

- **+5V** Connects to a 5V supply
- **GND** Connects to GND
- **ST_CP** Latch (storage register clock input)
- **SH_CP** Clock (shift register clock input)
- **DS** Data (serial data input)
- **Q7’** The output from the second shift register, use this when daisy chaining devices.

The output from this pin feeds in to the DS of the next device.
**STEP 5 – The LEDs**

These are placed at the top of the board; the LEDs have a long lead (the anode) and a short lead (the cathode). The short lead should go in to the hole closest to the flattened part of the circle.

**STEP 6 – ICs in to the sockets**

Now all of the components have been soldered to the board it’s time to place the two 74HC595 chips in to their sockets. They should be socketed so the notch on the chip is on the same side as the notch on the socket.

The chip on the left (the same side as the Octopus logo) should have its “notch” facing up, the chip on the right (furthest from the logo) should be facing down.

Before you try to carefully slot the chips in to sockets you’ll notice that the legs are spread out too much to fit. They’ll need to be bent inwards before they’ll fit. DO NOT FORCE THEM.

The way I like to do this is by very carefully pressing each side of the chip on my desk until both sets of pins are parallel. Once the legs are parallel it will take a bit of force to push the chips in to the sockets, be gentle and patient.

That’s all the hard work finished. You should now have something that looks like this:

Connect the board up to your microcontroller of choice and start having fun! Start off by downloading the examples from the address at the top of this document and experiment!
LED Colour Suggestions

All red

All yellow

All orange

All blue

All green

Temperature or sensor

Binary clock; hours, minutes and seconds

Alternate red/green
The pseudo-code for lighting up the LEDs on one board follows:

```plaintext
// send 16 bits, the first 8 go to the leftmost shift register
// the second 8 go to the rightmost shift register
Set the ST_CP (latch) low
Do this section 16 times, once for each bit:
{
    Set the DS pin (Data) to low or high (depending on data).
    Set the CLOCK to low.
    Set the CLOCK to high.
}
Set the ST_CP (latch) high
```

**Byte 1**  **Byte 2**  
87654321 87654321

Byte 2 sets LEDs 1–8, byte 1 sets LEDs 9–16. A “1” turns an LED on, a “0” turns it off.

It’s important to send the bits from LEFT to RIGHT. The MSB of byte 1 first; the LSB of byte 2 last.

Have a look at the example programs for more information on how to talk to the shift registers.
Example source code for the following platforms can be found here:
www.MaximumOctopus.com/electronics/cooper.htm

Arduino (and compatible boards) (arduino.cc)
Espruino (and compatible boards) (espruino.com)
PICAXE microcontrollers (picaxe.com)
Raspberry Pi (all models) (raspberrypi.org)

If you would like some example code for a different platform then please get in touch.

If you have any comments or suggestions for this kit then please let us know.
